

Performance Evaluation of MANET Protocols

Ali Researcher¹

¹ Department of Networks, Test University

Abstract

This synthetic paper verifies extraction of native Office objects. Throughput trends are shown in Figure 1 and protocol share in Figure 2.

Keywords: charts, extraction, MANET

Introduction

As Figure 1 demonstrates, throughput improves annually while latency drops. The distribution across protocols, given in Figure 2, favours AODV.

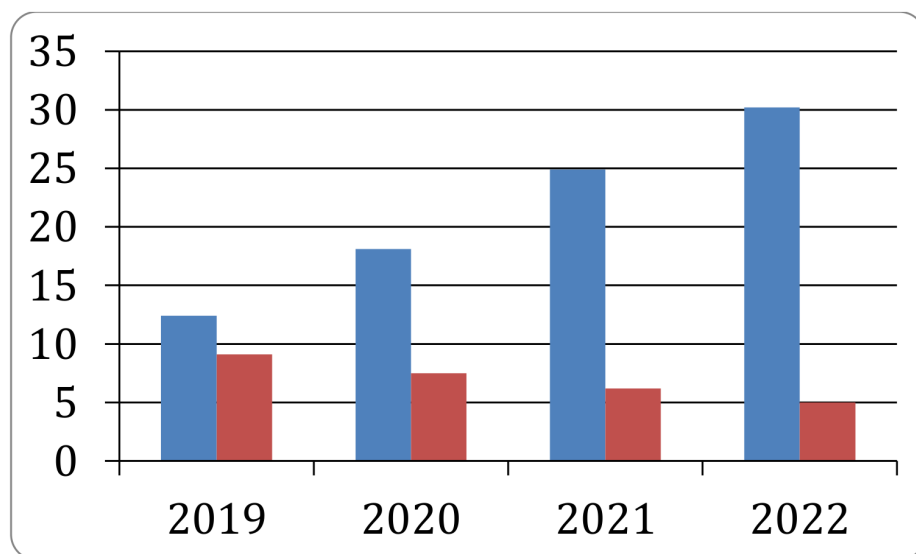

Figure 1: Yearly throughput and latency of the testbed.

Beyond raw performance, the routing share matters for deployment planning as discussed above and revisited in Figure 2.

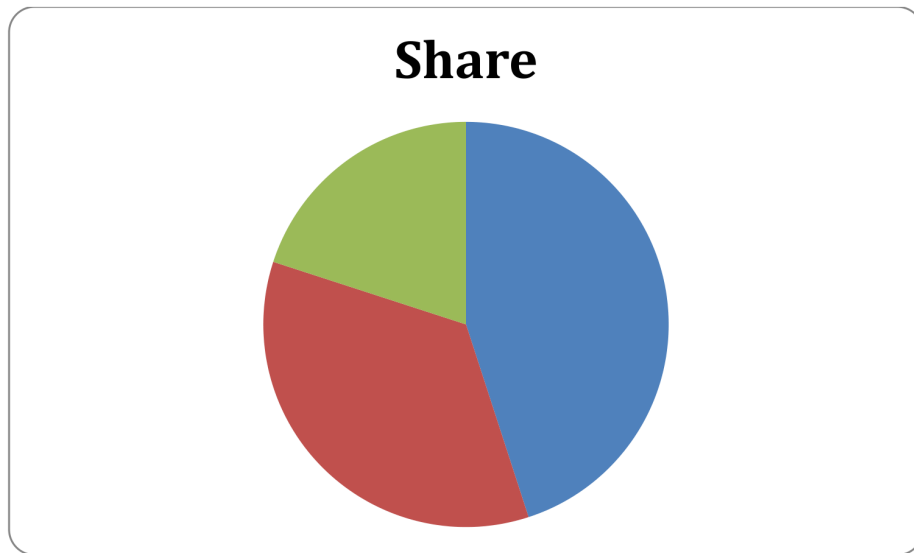

Figure 2: Protocol share in surveyed deployments.

Discussion

Figure 3: Decision flow rendered as a native shape.

The shape in Figure 3 and the annotation box summarise the method. Refer back to Figure 1 for absolute numbers.
